

Alcohol-based skin antiseptic containing iodine (Braunoderm®) for spray disinfection

It's in your hands – Infection prevention in veterinary medicine

Skin antisepsis

Spray disinfection

Perform hygienic hand disinfection and put on low-germ examination gloves.

Immediately before operating, trim the hair using clean, sharp clippers. Avoid wet shaving to prevent skin injuries. Use a paper towel or a (contactless) vacuum to remove the trimmed hair.

Clean dirt and oil from skin and decontaminate it before applying the antiseptic. Do this by rubbing cleansing foam into the skin and cleaning it. Goal = removing larger impurities and transient skin flora.

After one minute, any foam residue can be removed with a clean cloth. Bring the patient into the OR. Position the patient safely for the procedure.

Before applying the antiseptic, disinfect hands and put on sterile surgical gloves.

Aseptic: Goal 1) rapid, significant reduction of resident skin flora; 2) long-lasting (remanent) aseptic effect. Spray Braunoderm® on the skin until it is thoroughly saturated.

Skin antisepsis

Spray disinfection

Use a sterile swab to wipe off any remaining Braunoderm®, moving from the center to the periphery. Use a new sterile swab each time. Repeat this process a total of three times.

Finish by moistening the skin once more with Braunoderm®.

After the exposure time has elapsed, the surgeon may apply a sterile dressing to the patient.
